for the Department of Energy
comments on CRCIA

My name is Charles Sullivan. I have a B.S. in Biology from
P.S.U. 1986. I live in Portland, Oregon.

I have read most of the screening assesment and requirements
for the CRCIA, pub. 1997.

My comments follow:

1.) Assesment Scenarios Part II Part 1.10

My major concern here is including the unconfined aquafer
specifically and monitoring with respect to the Yakima
farming community to detect any backflow in future climacteric
and geological events.

2.) Evaluation by Segment 5.2.7

My only question on this section is the location of the K
east and west basins for the storage of solid canisters and the
location of effluent in seeps from sludge. Are they in segment
4 or 17?

3.) Fish Hatchery Worker PartII Part 5.1.2.2

My concern with this risk assesment is that in processing large numbers of fish in the future there may be exposure to aerosols containing animal wastes with radionuclide contaminants already complexed in organic ligands which may alter bioconcentration differentials.

I Thank you sincerely for your efforts in this area,

Charles Sullivan
